

**ROSA Advisory Council** June 18, 2025

#### Agenda

1:00pm Welcome, Introductions, Agenda Review

- 1:15pm ROSA Updates
- 1:50pm Floating OSW Co-Design Project
- 2:05pm Partner Updates
- 2:40pm Break
- 2:45pm Research Highlights
- 3:25pm Action Items, Next Steps, and Other Business
- 3:30pm Adjourn

# Introductions

#### Welcome Vincent Balzano to the Board

Capt. Balzano is the newest member of the ROSA Board of Directors.

- Third-generation fisherman with over 30 years of fisheries management experience,
- Served nine years on the New England Fisheries Management Council.
- Active in the groundfish sector, fishing out of Portland, ME & Gloucester, MA.

#### 2025 ROSA Internship Update

#### Maryam Kraus

Tori Newton

ROSA

Please welcome our 2025 interns!

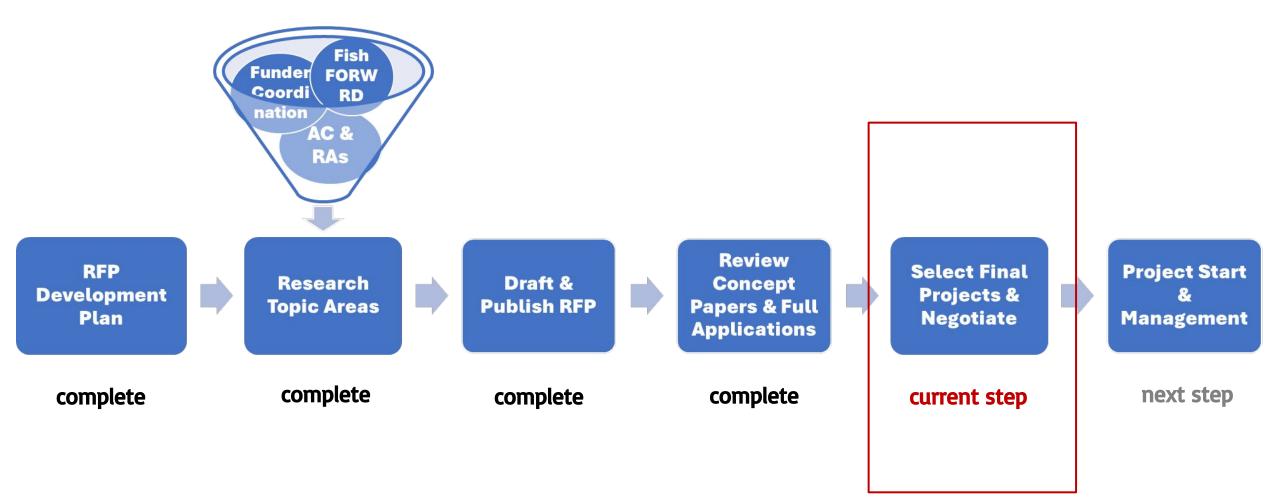

# **ROSA Updates**

# **Regional Research Program** Tricia Perez

#### **ROSA RFP Development Process**

#### **Advancing Regional Solutions for Fisheries and Offshore Wind**

| Topic Area   | # Projects Selected |
|--|---------------------|
| Supporting Fisheries Access  | 3 PROJECTS          |
| Understanding Potential<br>Offshore Wind Impacts to<br>Larval Fish   | 1 PROJECT           |
| Fisheries Monitoring: Data<br>Integration, Evaluation, &<br>Analysis | 6 PROJECTS          |

Please note that the projects are not considered formally awarded until a contract has been fully executed by ROSA and the selected research entities, therefore the project awards and obligation of funds is not final.

48 Concept Papers Received
24 Full Applications Invited
23 Full Applications Received

10 projects selected

ROSA

## **PROJECT SELECTION OVERVIEW**

| Topic Area              | Lead Entity                          | Short Title   | Region<br>Addressed |
|-------------------------|--------------------------------------|---|---------------------|
|                         | UMaine                               | Co-Locating a Fixed Gear Fishery with a Demonstration<br>Scale Floating Offshore Wind Turbine | GOM                 |
| Supporting              | SMAST                                | Gear Monitoring Technologies for Safe Fishing in OFW  | SNE                 |
| Fisheries Access        | GMRI                                 | Supporting Fisheries Access in the Gulf of Maine  | GOM                 |
| Larval Impacts          | SMAST                                | Black Sea Bass Connectivity   | SNE                 |
|                         | NEAQ                                 | Impact of wind development on pelagic fishes  | SNE                 |
|                         | SMAST                                | OFW Regional Monitoring and Analysis  | SNE & Mid           |
|                         | ASA Analysis &<br>Communication, Inc | Multi-frequency Acoustic Monitoring of Regional<br>Offshore Wind Impacts                      | SNE                 |
|                         | Smithsonian                          | Effective Acoustic Telemetry  | SNE & Mid           |
|                         | UMCES                                | Flyway Model  | SNE & Mid           |
| Fisheries<br>Monitoring | Inspire<br>Environmental             | Fisheries Monitoring Mapping Tool   | SNE & Mid           |

# **Data Governance Program** Mike Pol

# Data Governance Program

**Goal:** To develop guidance for reuse of offshore wind fisheries data, in support of future regional or cumulative impacts assessments.

**Focus** on data streams from methodologies used in monitoring plans and OSW research

Leveraging data expertise of Intertidal Agency

**Coordinate** with ROSA RFP policies and requirements and RWSC

#### **Outcomes:**

- standardized data management practices
- support interoperability and reuse with other data efforts in the region

Supported by Avangrid, Ørsted, Attentive Energy, and AKRF

## **Environmental Data Sharing Workshop**

- Recommendation #5 from <u>GAO Report on Actions Needed to Address Gaps in Interior's Oversight of Development</u> (Apr. 2025): "The BOEM Director should develop guidance and specific requirements for lessees' data collection and sharing across offshore wind energy projects."
- **Goal**: To develop an actionable strategy for ocean-based environmental data sharing and an implementable pilot program that enables the U.S. offshore industry to effectively share knowledge of environmental data that will benefit all stakeholders.
- Objectives:
  - Determine data being generated and shared, and what must be commercially protected.
  - Establish a common understanding of challenges with data sharing and develop an action plan.
  - Determine desired industry outcomes and areas where industry data sharing is most likely.
  - Identify subset of possible data types and collection methods that might benefit from standardization.
- 1.5 days (Wednesday, Thursday last week) in D.C.
  - First day: Establishing common understanding through status of data streams and examples
  - Second day: Three data streams (PSO, oceanographic data, benthic image data) with breakouts groups in the PM

### **Environmental Data Sharing Workshop**

- ROSA, RWSC, NROC, and MARCO data efforts were described
- Components and scope of sharing defined
- Current state of data sharing by industry cloud or hard drives primarily
- Some existing repositories with appropriate capability
  - RWSC list: <u>https://rwsc.org/research-data</u>
- Many barriers to sharing, can be categorized as:
  - Purpose and process
  - Legal and contractual
  - Technical
- Examples: POWERON, UK Marine Data Exchange, US Navy Marine Species Monitoring Program, GOM-PROP, UNISON

## Environmental Data Sharing Workshop

Benthic visual imagery takeaways

- Regulatory need for images that have information with bathymetry
- Developers often provide a method for viewing and sharing
- Potential cost savings to developers in a single site and data viewer
- Single site also encourages standardization of file names and other file level metadata
- Prior positive response by developers to suggestions and recommendations from BOEM
- ROSA WG to focus on metadata standards

Action plan will be forthcoming in the next few months

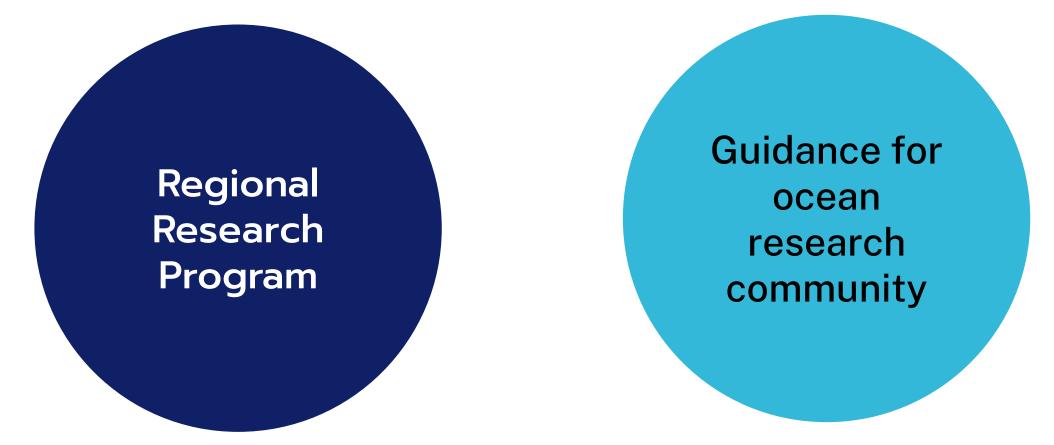

# **Questions?**

## Data Governance Briefing

- Inform broader community to encourage support for ROSA's Data Governance Program beyond current efforts
- Held May 29, 2025 with over 70 attendees.
   Slides are <u>posted</u>.
- Described the evolving data landscape, including ROSA's Data Governance through Regional Research Program and DG Committee
- Reviewed regional partnerships
- Encouraged support through engagement as well as sponsorship

#### Two Primary Pathways to Improve Data Governance

DG Working Groups Where should ROSA recommend people publish fisheries-related data?

How should data be organized to maximize discovery and reusability?

What else can ROSA do to support this?

For the specific sampling method, we want work groups to discuss & recommend

- Documentation (including metadata)
- Metadata standards and recommended repositories
- How to organize and structure datasets within a 'project'
- Any other specific info to be included (i.e. special fields, tags)
- Catalog of experimental designs used
- How to be good managers for our future selves?
- How to preserve and publish data to answer regional questions?

Image Working Group

- Two meetings so far, third planned
- Good representation from primary data collectors
- Discussed range of data sources in area
- Which data are collected from each image
- Challenges to sharing
- Opportunity to collectively use images to train machine learning
- Processing methods
- Considered candidate repositories
- Discussed data sharing amendments to existing agreements

Fishing Gear Data Working Group

- Two meetings so far, third planned
- Discussed options for repositories
- Explored scenarios where sharing data would illustrate possibilities for deeper understanding
- Identified the need for clear, consistent data licensing agreements
- Cross-walk of metadata from several trawl surveys
  - Metadata tools are needed
- Assessment of number and size of data holdings

## Working Timeline

FEB Up to 3 work groups formed MAR - JUN Work groups draft recommendations, with support from Intertidal & ROSA JUL - SEP drafts out for community comment, feedback incorporated

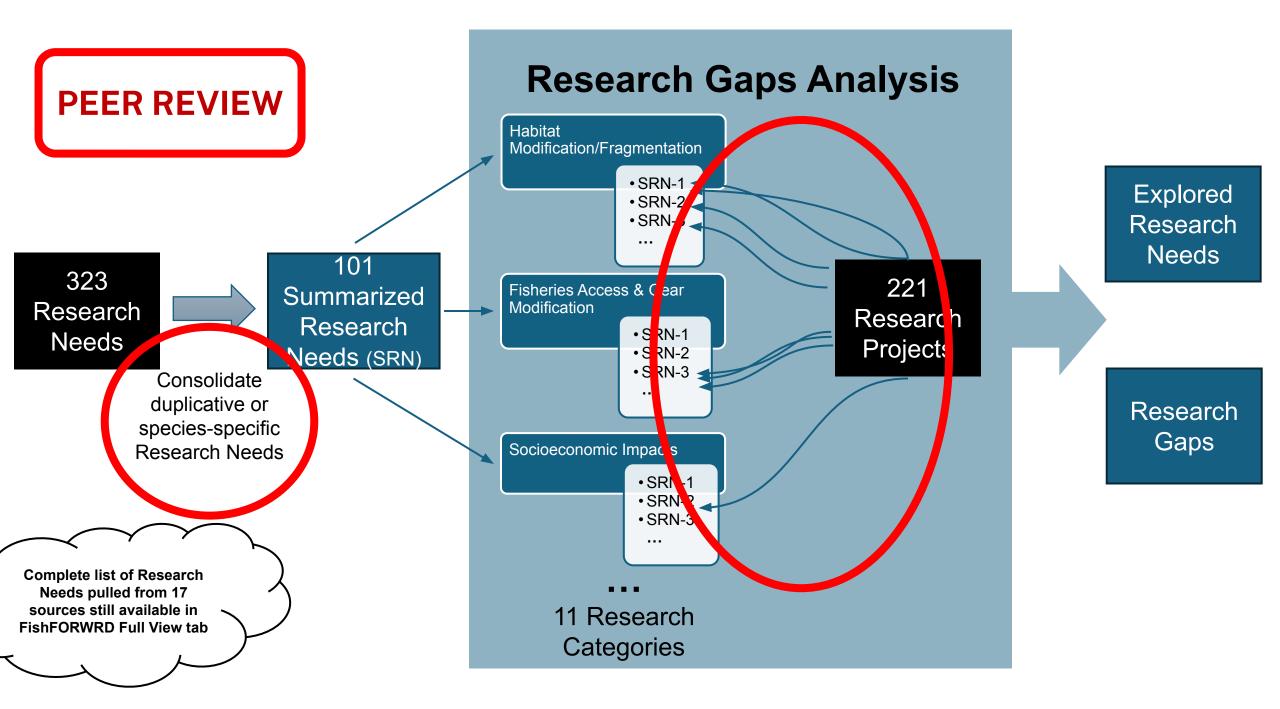

**OCT** v1 materials released by ROSA

#### Joint Image & Fishing Gear Data Group

 Tuesday, June 24, 15:00 – 16:00 by Zoom

## **Research Gaps Analysis Peer Review** Tricia Perez

### 2025 Peer Review of ROSA Gaps Analysis

#### Purpose

The purpose of the **Research Gaps Analysis** is to create a common understanding of progress made and research still needed to understand the impacts of offshore wind on fish and fisheries on the U.S. East Coast

The purpose of the **2025 Peer Review** is to assess the methods used to conduct the Research Gaps Analysis and validate the results.

### 2025 Peer Review of ROSA Gaps Analysis

| TEAM | RESEARCH CATEGORY   |  |  |  |  |  |  |  |  |
|------|---|--|--|--|--|--|--|--|--|
| 1    | Cumulative Impacts & Fisheries Management<br>Implications |  |  |  |  |  |  |  |  |
|      | Data Management   |  |  |  |  |  |  |  |  |
| 2    | EMF   |  |  |  |  |  |  |  |  |
| 2    | Sound/Vibration Impacts                                   |  |  |  |  |  |  |  |  |
|      | Fisheries Engagement & Capacity Building                  |  |  |  |  |  |  |  |  |
| 3    | Fishery Access & Gear Modification                        |  |  |  |  |  |  |  |  |
|      | Socioeconomic Impact                                      |  |  |  |  |  |  |  |  |
| 4    | Habitat Fragmentation/Modification                        |  |  |  |  |  |  |  |  |
| 5    | Species Distribution/Composition                          |  |  |  |  |  |  |  |  |
| 6    | Survey Adaptation   |  |  |  |  |  |  |  |  |
| 0    | Resource Monitoring                                       |  |  |  |  |  |  |  |  |

# **Outcomes of Peer Review**

#### Benefits

- Peer reviewed results by ROSA community
- $\cdot$  Provide efficiency for funders
- Facilitate next generation of scientists and new research ideas
- Inform future developer Fisheries Monitoring Plans

#### Deliverables

- Final Report THIS FALL
- FishFORWRD Gaps Analysis Tab

Used to inform future ROSA RFP Topic Areas

## Sunrise Wind/ROSA Research Agreement

- Ørsted's Sunrise Wind project selected in NY4 Solicitation requiring \$5,000/MW for fisheries and offshore wind research
- Topic Areas Selection Process
  - Peer Reviewed Gaps Analysis (FishFORWRD)
  - Advisory Council
- RFP
- Project Management Process

#### Update on Wind Symposium at the AFS 2025 Annual Meeting

- American Fisheries Society Annual Meeting, San Antonio, Aug. 10-14
  - Early registration extended to July 8th
- Offshore Wind, Fish and Fisheries Symposium
  - Co-convening with BOEM, NMFS, RODA, NYSERDA, TNC, TetraTech
  - Expecting a mix of 23 talks and posters
  - Topics generally in four categories
    - habitat/reef effects; survey impacts; monitoring; miscellaneous
  - Tricia will be presenting on the Gaps Analysis
  - Discussion sessions at the end of each day
- ROSA will have a booth on the Exhibit Floor drop by to see Tricia and Mike!

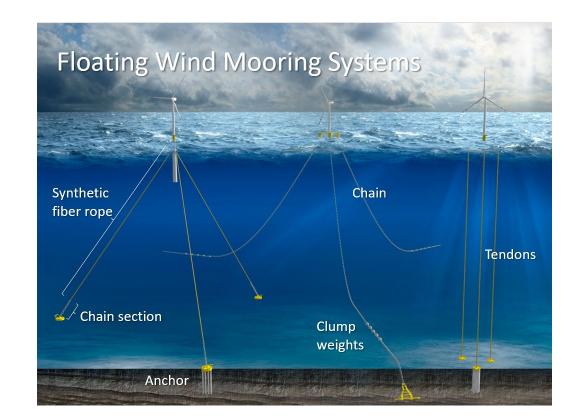

Co-Design Solutions for U.S. Floating Offshore Wind Farms and Fishing Compatibility

National Renewable Energy Laboratory (NREL) University of Maine Responsible Offshore Science Alliance (ROSA)

This project is funded by National Offshore Wind Research and Development Consortium (NOWRDC) and ROSA's work was supported with funding from the Alliance for Sustainable Energy, LLC, Managing and Operating Contractor for the National Renewable Energy Laboratory (NREL) for the U.S. Department of Energy.

# Background

- Floating wind presents unique challenges compared to fixed-bottom. Potential to interact with commercial and recreational fishing gear and limit fishing access:
  - Platform
  - Mooring lines
  - Dynamic cables
  - Anchors
- U.S. floating wind designs are still being developed and the opportunity exists to co-design novel floating wind technology solutions to mitigate risks to the fishing community

Develop novel floating array design concepts for the U.S. industry through a co-design process with U.S. commercial and recreational fishermen that optimize the potential for floating wind farms to coexist with fishing activities.

# Project Update & Team

• **Project Update:** Project resumed on 6/1/2024

- Project Team
  - **NREL** Project lead and floating wind mooring design tools
  - **ROSA** Fishing industry engagement in the Central Atlantic
  - University of Maine Fishing industry engagement in the Gulf of Maine
  - **Fishing industry** Involvement of commercial and recreational fishermen in participatory co-design process

# 

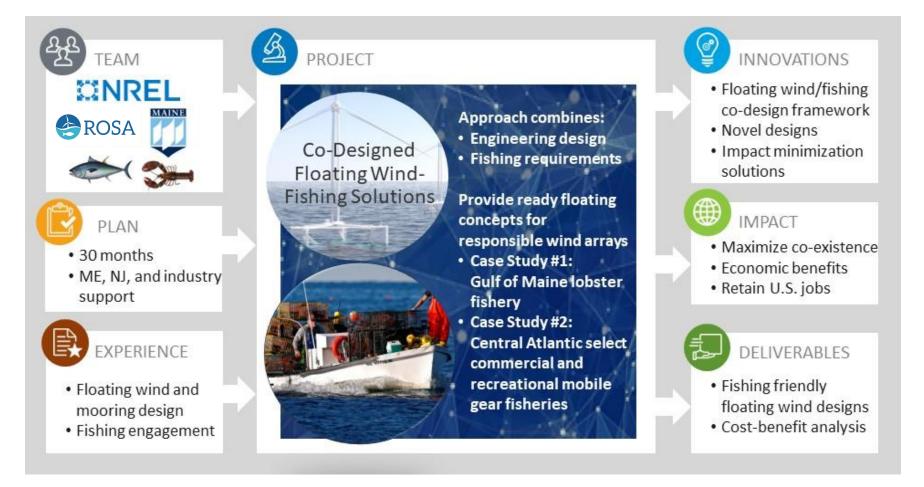

# Objective

Develop novel floating array design concepts for the U.S. industry through a co-design process with U.S. commercial and recreational fishermen that optimize the potential for floating wind farms to coexist with fishing activities.

## **Project Schedule**

| Task Month:   | 1 2        | 3 4 | 5          | 6 7     | 8          | 9 10 | 11 2       | 13 14             | 4 15 1     | 6 17       | 18 19 | 20 21      | 22 23      | 24 25 2    | 6 27 2     | 8 29 30    |

# **Co-Design Framework**

- Gather input from fisheries and literature
- Categorize fishery spatial requirements
- Evaluate design variables at the single turbine scale (mooring, cables) and the array scale (turbine spacing, orientation)
- Balance cost and Annual Energy Production (AEP) impacts with improving fishing access

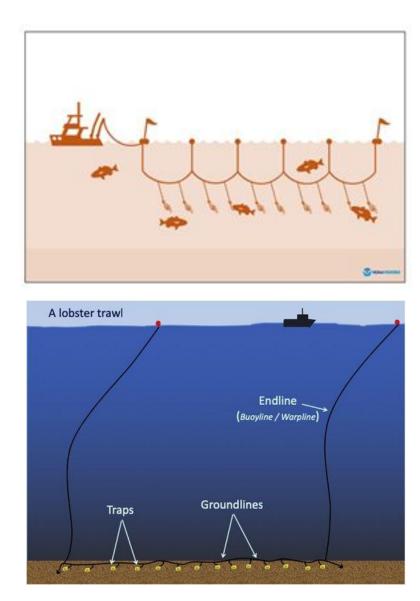

# Fishing Engagement

Gulf of Maine (Fixed Gear Case Study):

- 4 interviews completed
- 59 87 minutes

Mid-Atlantic (Mobile Gear Case Study):

- 2 interviews completed
- **135 180** minutes

# Fishing Engagement - Space Needed

- Lobster: 1 nm
  - 1.2 x bad weather drift of 25 trap trawl
- Gillnet: 0.9 nm
  - 1.2 x highest drift number estimated by fisheries (0.75 nm)
- Fish pots: 180 ft
  - 1.2 x spatial requirement (25 fa)

- Demersal (bottom) Long Line: 1.2 nm
  - 1.2 x spatial requirement
     (1 nm)
- Pelagic Long Line: 24 nm
  - 1.2 x gear length (also bad weather drift) (20 nm)
- Rod and reel: 0 m
  - Indicated could fish as close as possible to infrastructure if the fish were there

# Fishing Engagement

# Single-Turbine Scale

Mooring anchoring radius is the most critical design variable

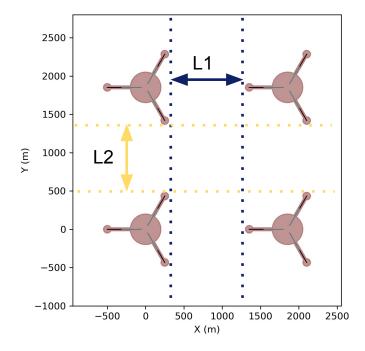

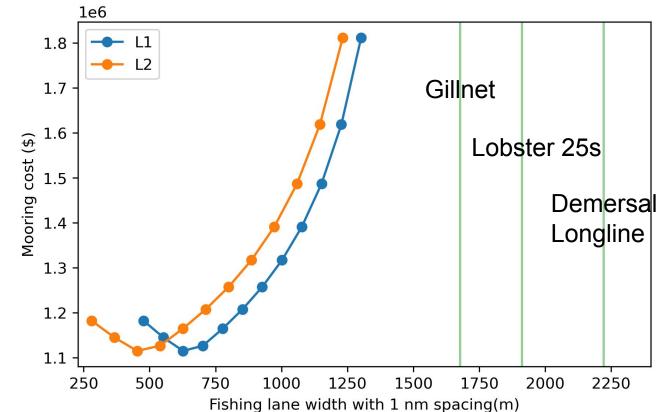

Decreasing the mooring anchoring radius increases the cost

# Single-Turbine Scale

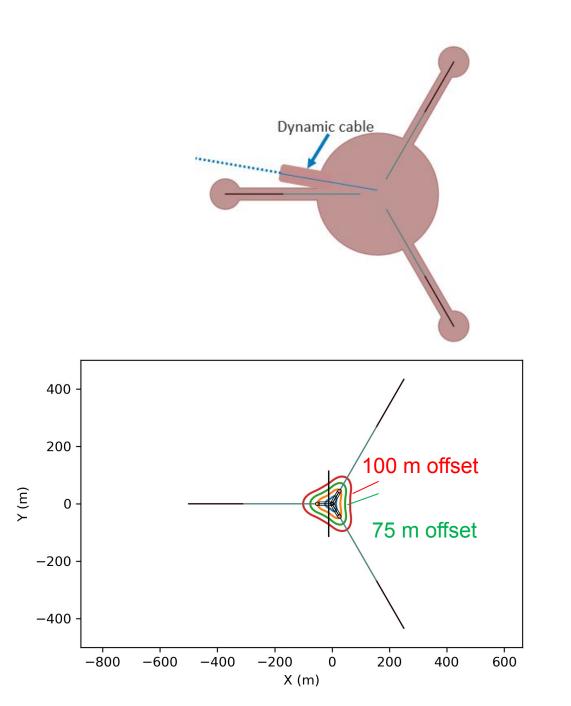

- With 1 nm spacing, some gear types won't fit between anchors
- Need to consider more irregular patterns

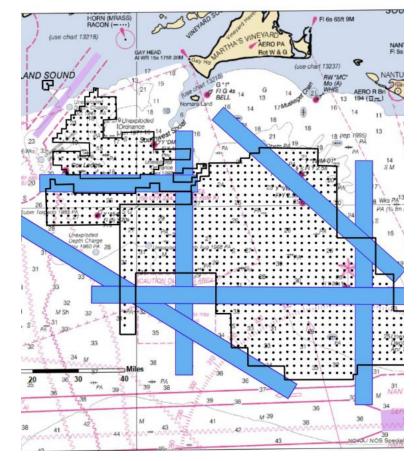

# Single-Turbine Scale

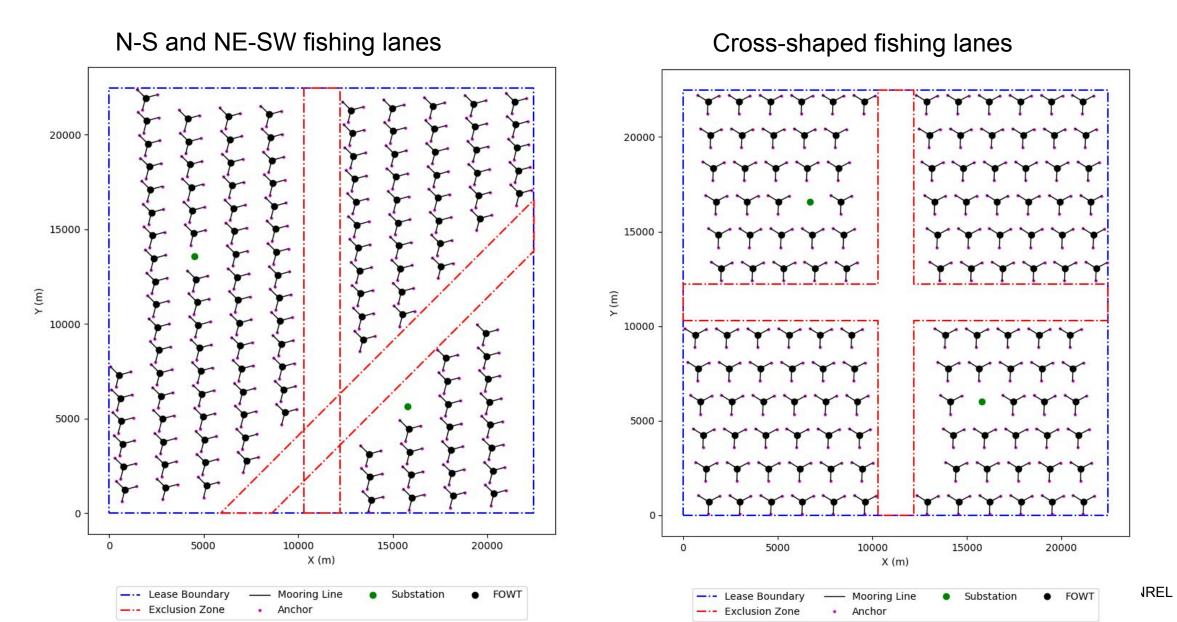

- Additional considerations:
  - Cable touchdown point is less than mooring radius, so cable design is of lower importance
  - Platform offsets are small relative to the mooring anchoring radius

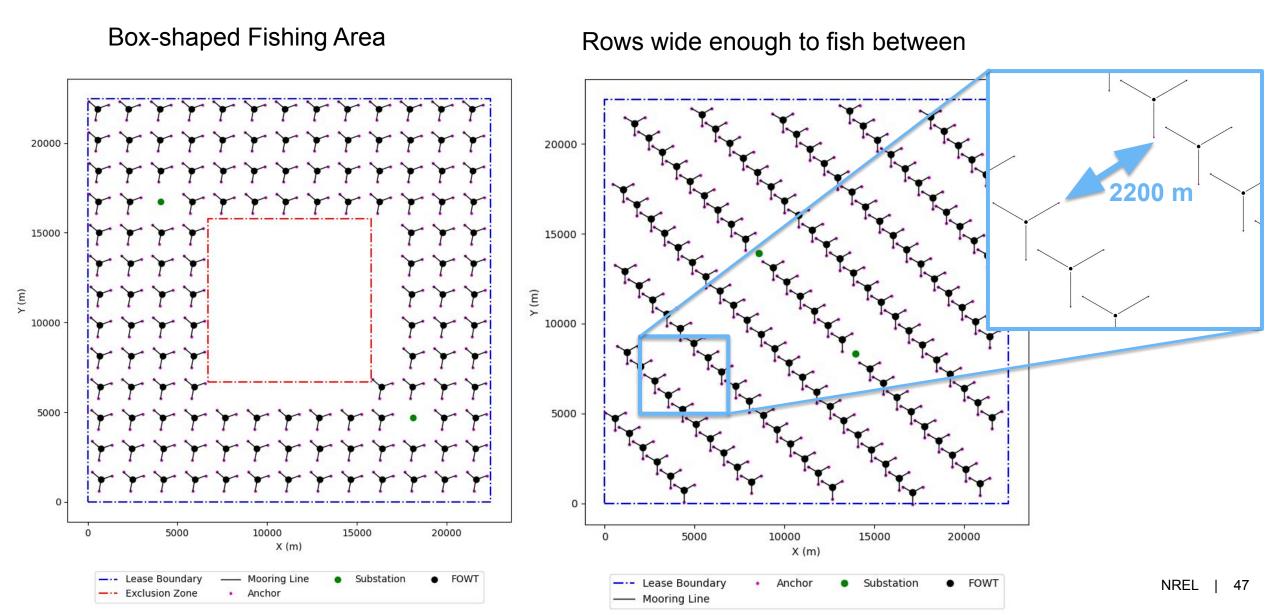

- Lit review
  - Responses to BOEM proposed lease area layouts
  - Previous co-design work
- Fishing interviews
  - Gear size, drift, spatial requirements, deployment methods
- Key takeaways:
  - Fishing compatible layouts are site specific, not a one size fits all solution
  - Transit lanes are a common request by fisheries
  - Uniform grids (predictable) layouts are preferred by fishermen and USCG

RODA proposal sent to BOEM, NOAA, and USCG: Proposal for New England wind energy project layout with transit lanes for safe passage of vessels

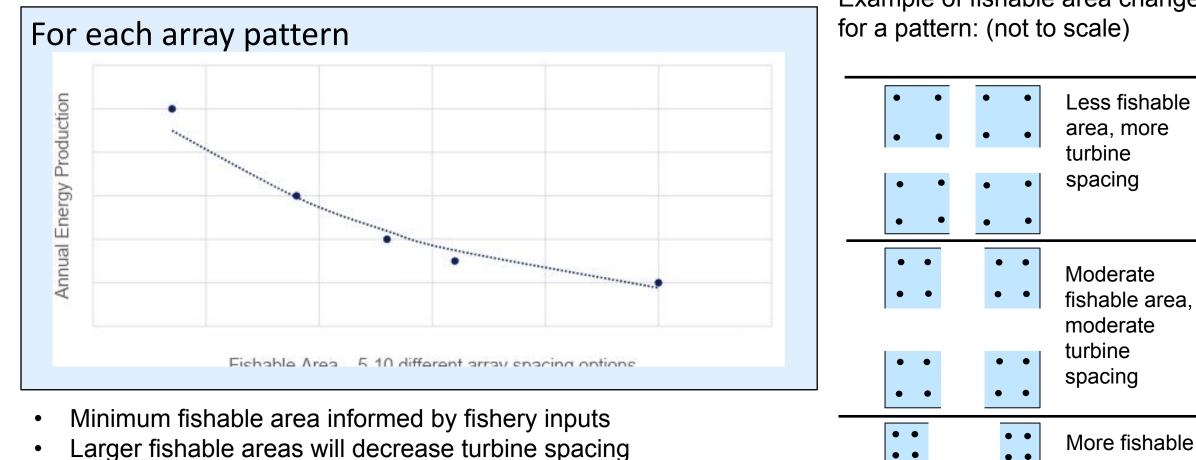

46

Goal: analyze AEP vs fishing tradeoffs for a range of possible

.

patterns

Example of fishable area changes

NREL 48

area, less

turbine

spacing

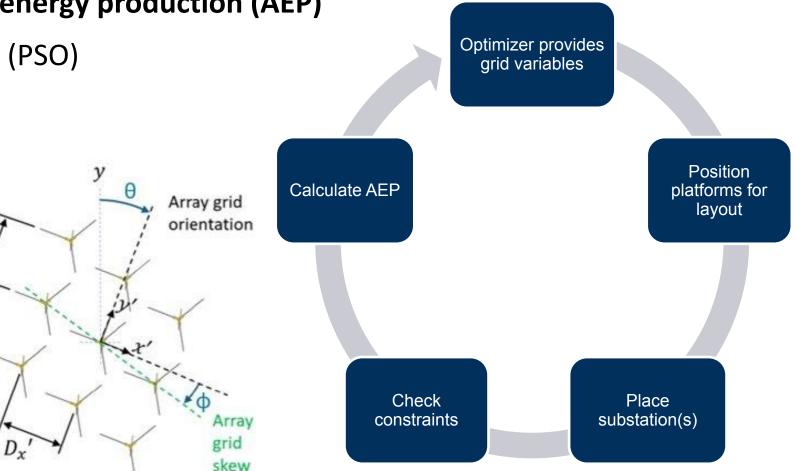

# Array Scale Optimization

#### Layout optimization for annual energy production (AEP)

 $D_{\nu}$ 

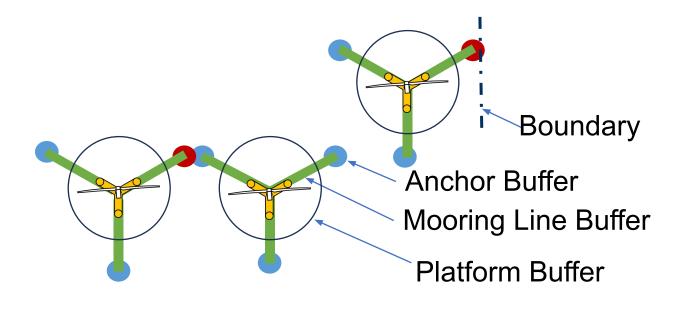

- Particle Swarm Optimization (PSO)
  - Gradient-free
- Design variables
  - X and Y spacing
  - X and Y translation
  - Grid orientation
  - Grid skew
  - Turbine orientation

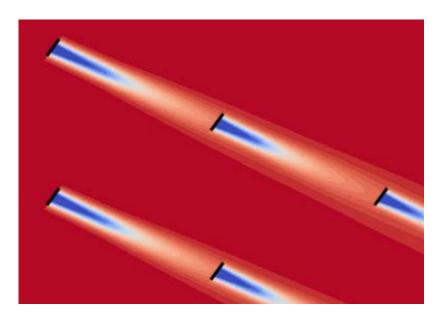

Challenge: layout optimizations are slow

# Array Scale Optimization

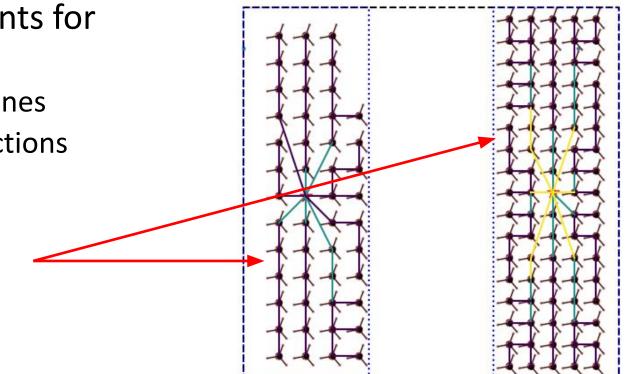

- Constraints check component crossing
- Buffer zones on components may not cross boundaries or exclusion zones
- AEP calculated from FLORIS (steady-state wake model)

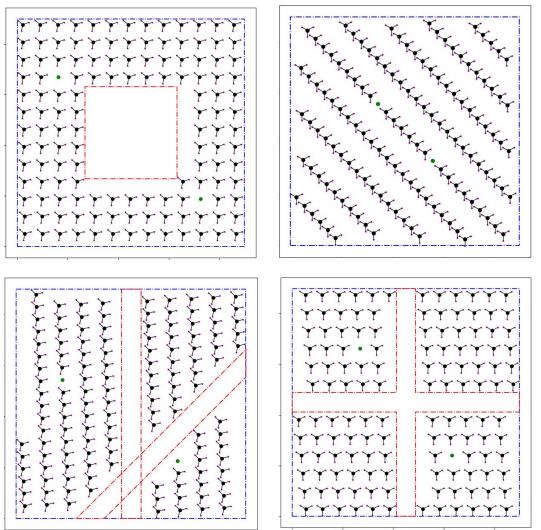

# Array Scale Optimization

- Optimization tool improvements for fishing-friendly arrays:
  - Variable geometry exclusion zones
  - Different grid spacing in subsections
  - Runtime improvements

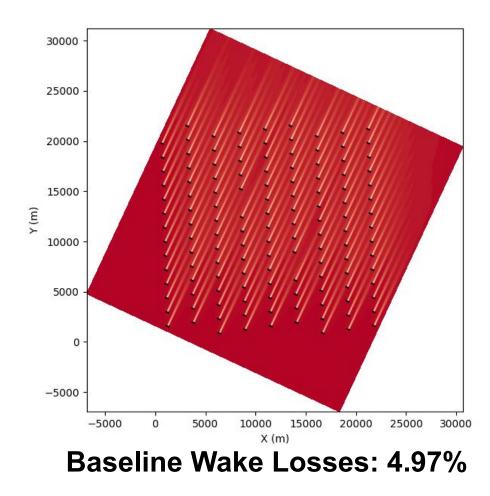

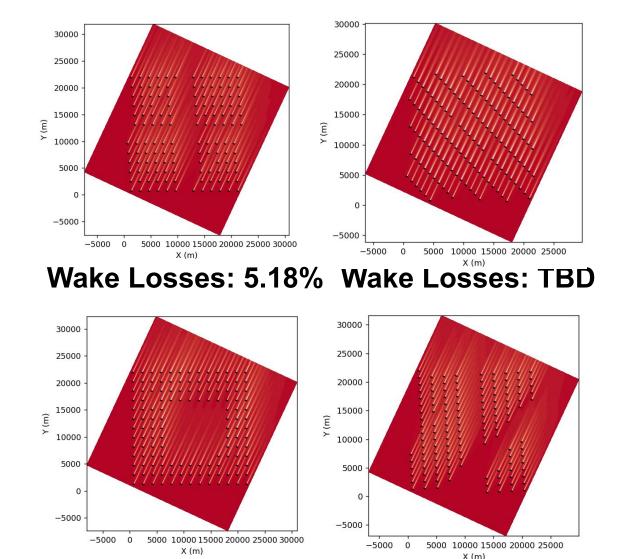

# Fishing Friendly Array Designs

- Currently developing AEP-optimized layouts for the defined fishing lane ideas
- In the case studies, these layouts will be shown to fishermen for their feedback

### Layout Design Wake Losses

Wake Losses: 5.28% Wake Losses: 5.65% REL | 53

### Next Steps and Challenges

- Develop representative site conditions for Gulf of Maine and Mid-Atlantic.
- Apply design models and optimize layouts for GOM.
- Share optimized layouts back to original interviewees and other fishermen in GOM.
- Release of report on fishing input has been paused by NREL.
- Continuation of the project contingent on DOE approval or identification of other funds by NOWRDC.

### Next Steps

#### Task 2:

- Complete re-design baseline with updated tools
- Report on design tools and updated baseline

Task 3:

• Gulf of Maine case study site conditions and fishing assumptions

| Task  | Month:         | 1   | 2          | 3 4        | 5          | 6  | 7 8        | 9 | 10 1   | 11 :       | 2 13                        | 14         | 15 16 | 6 17       | 18 1 | 19 20      |

| 1.3. Conduct interviews with fishing participants     |                |     |            | -          | $\diamond$ |    |            |   |        |            | ł.                          |            |       |            |      |            |
| 1.4. Summarize and prioritize focal fisheries requ    | irements       |     |            |            |            |    | >          |   |        |            |                             |            |       |            |      |            |
| Task 2: Fishing Co-Design Framework Developmer        | nt             |     |            |            |            |    |            |   |        |            | 1                           |            |       |            |      |            |
| 2.1. Construct baseline design incl. moorings and     | cables         |     | 1          |            |            |    |            |   |        |            | i.                          |            |       |            |      |            |
| 2.2. Formulate fishing coexistence constraints and    | d metrics      |     |            |            | +          |    | >          |   |        |            | i i                         |            |       |            |      |            |
| 2.3. Incorporate realistic industrialized design (tie | e in to stdm)  |     |            |            |            |    |            | < | $\geq$ |            |                             |            |       |            |      |            |
| 2.4. Updated design models for co-design case stu     | udies          |     |            |            |            |    |            |   |        |            | $\langle \! \! \! \rangle $ | 63         |       |            |      |            |
| Task 3: Implement Gulf of Maine Case Study            |                |     |            |            |            |    |            |   |        |            | i                           |            |       |            |      |            |
| 3.1. Identify representative site conditions and fi   | shing assumpti | ons |            |            |            |    |            |   |        |            |                             | <          | >     |            |      |            |
| 3.2. Apply design models and develop optimized        | solutions      |     |            |            |            |    |            |   |        |            | 1                           |            |       | <          | >    |            |
| 3.3. Adjust design solutions based on feedback fro    | om fishermen   |     |            |            |            |    |            |   |        |            | 1                           | ос.        |       |            |      |            |

# **Questions and Feedback?**

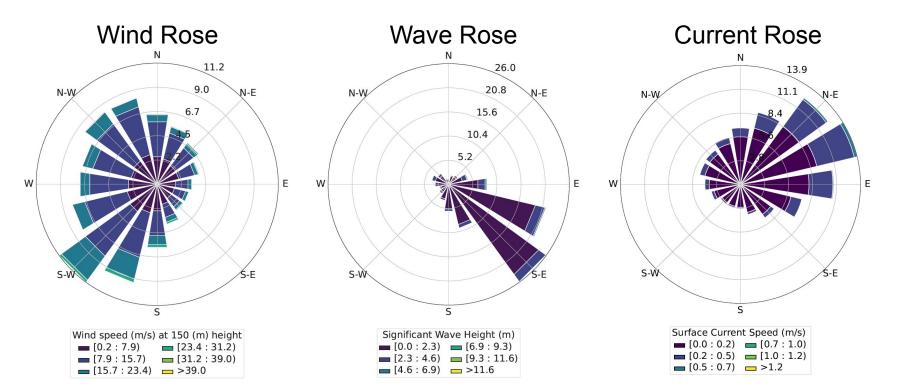

www.nrel.gov

### **Baseline Design**

Baseline array design consists of a turbine layout, mooring system, anchors, and dynamic cables that does not consider fishing coexistence

- VolturnUS-S and IEA 15 MW
- East Coast site conditions Gulf of Maine
- 150 m water depth

### Baseline Design

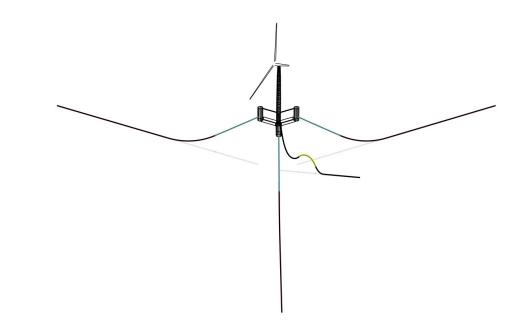

Mooring design

- Semi-taut and catenary designs initially considered
  - Semi-taut design chosen
- Evaluated extreme tensions in key load cases
  - DLC 1.6, 6.1, and SLC
- Fatigue analysis for chain sections

Cable Design

- Lazy wave configuration
- Evaluated extreme tensions and curvature in key load cases

Final Semi-taut Configuration

### Action Items, Next Steps, and Other Business

• Upcoming ROSA Events

RC

# Partner Updates

### Massachusetts Fisheries Innovation Fund Request for Proposals – Solicitation 1 Update

Brad Schondelmeier

*Offshore Wind and Fishery Specialist* Massachusetts Division of Marine Fisheries

# Massachusetts Fisheries Innovation Fund Update

- Fisheries Innovation Fund (FIF): \$1.75m mitigation fund created by Vineyard Wind to "support programs and projects that ensure safe and profitable fishing continues" as current and future offshore wind projects are developed
- Other developers will add mitigation funds to FIF, possibly \$2.3-4.8m in future

#### Progress Update

May: Finished FIF Request for Proposals draft for funding Solicitation1

FIF Advisory Panel met to approve RFP priorities, scale, eligibility and evaluation criteria

June: Finalize RFP – Solicitation1 with EEA, post to CommBuys and on DMF website

# Fisheries Innovation Fund – Solicitation 1

Project Priorities

Fishing Innovation

Community

Safety

Scale of Funding
Up to \$750,000 funding, with projects ranging from \$25,000-\$300,000 total

• Projects up to 3 years in duration

#### **Eligible Entities**

Commercial fishing businesses, non-profit fishing or research organizations, shoreside infrastructure businesses, academic institutions or public sector entities

#### **Evaluation Criteria**

Support for co-existence of marine fisheries and offshore wind development, direct engagement (or collaboration) with commercial or for-hire fishing, etc.

#### <u>Timeline</u>

Release Solicitation: End of June | Proposals Due: August 15 | Projects Start: January 1, 2026

#### Learning from Scotland's Experience with Floating Offshore Wind– A Study Tour for Maine's Fishing Industry

**ROSA Advisory Council Meeting** 

June 18, 2025

SAMBAS Consulting LLC

- Maine Offshore Wind Research Consortium established through bipartisan legislation in 2021 to advance understanding of FOW impacts in the Gulf of Maine
- Consortium Advisory Board comprised of a diverse group of ocean users and stakeholders to collaboratively pursue high-priority research guided by their Research Strategy
- Research Strategy identifies the following strategies:
  - Share knowledge and promote joint learning about FOW technology
  - Collaborate and partner with government entities and other organizations focused on FOW research and monitoring
- Maine partnered with Carbon Trust and SAMBAS Consulting to organize the study tour
- State of Maine applied for and received funding through a Maine-based private foundation to fund the Maine-based participants

### Objectives

- Establish a common understanding of FOW technology
- Understand the status of FOW development in Scotland, including planning and policy, science and research, and engagement with the fishing industry
- Learn about Kincardine FOW project, focusing on the technology employed, the design and installation process, and the engagement with the fishing industry and wider coastal communities during its development
- Exchange best practices for assessing and mitigating the impacts of FOW development on the fishing industry and wider coastal communities

- Organizers
  - Carbon Trust
  - SAMBAS Consulting
- Policy makers
  - Maine DMR
  - Maine GEO
  - Massachusetts DMF
- Fisheries
  - Broad group of fishermen and fisheries organizations

**Engagement Sessions** 

- Scottish Government
- Carbon Trust
- Developers
  - Ocean Winds, Orsted, SSE
- University of Edinburgh
  - FloWave
- Peterhead Port Authority
- Scottish Fishermen's Federation

# **Key Takeaways- Kincardine FOW Farm**

#### **Key Takeaways- Fisheries Perspective**

- Many similar issues Data gaps, lack of research & monitoring in and around arrays and export cables
- Scottish fishing industry:
  - Mostly excluded from leasing process (similar to SNE)
  - Sees FOW arrays as non-mobile gear zones regardless of anchoring type
- Still unresolved grid and connection issues How to get wind power to areas of need
- Port infrastructure needs totally different for FOW, Scotland infrastructure is getting there, US has to consider what port(s) can be upgraded or developed to support FOW
- Scottish government considering creating additional sanctuary areas to mitigate for impact of OSW, creating possibility of >50% closure of Scottish waters to fishing

### Key Takeaways- High-level

- Compared to Scotland, feelings that the Gulf of Maine siting/leasing process was OK and used outreach and fisheries data to deconflict Lease Areas
- Many of the same research questions and limited funding
  - EMF, displacement modeling, coexistence, cumulative impacts
- See potential for fixed gear fishing within arrays but mobile gear will be highly dependent on layout
  - Anchoring footprint, inter-array cable routing design and burial/suspension a large factor
- Monitoring and enforcement a big question in Scotland
  - No equivalent of BSEE to ensure lease terms are being met
- In Scotland, both developers and fisheries want more government intervention to facilitate coexistence and baseline statutory requirements
  - Lot of issues around mitigation
  - No guidance or uniform method on fisheries direct compensation

## **Proposed Vision and Mission Statements**

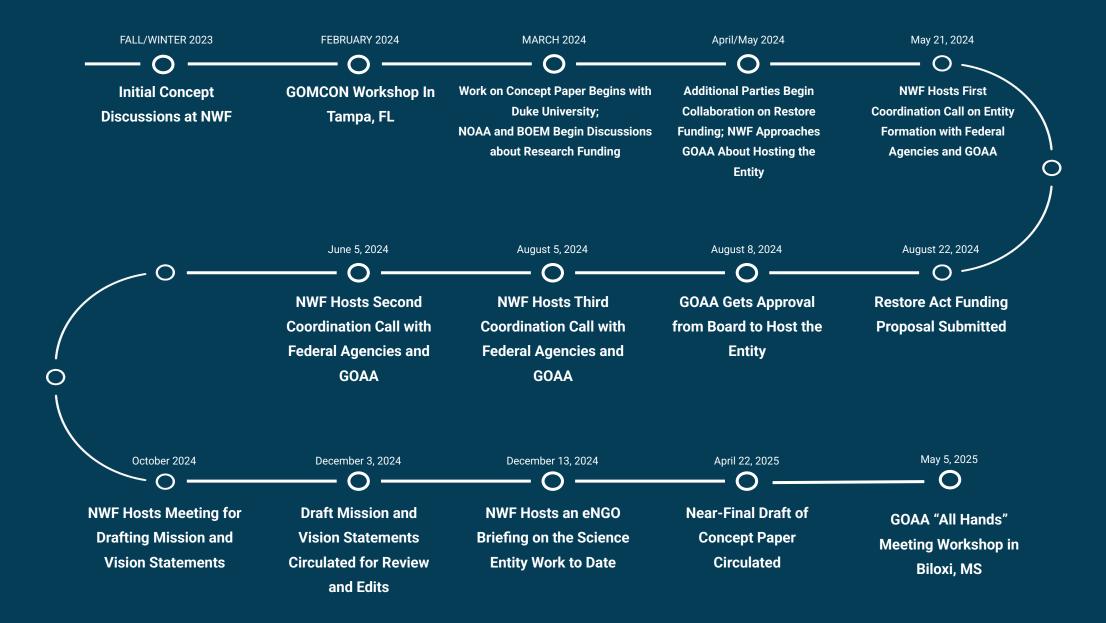

### DRAFT MISSION STATEMENT

To facilitate the collection, standardization, and dissemination of credible research and monitoring data on wildlife and marine ecosystems and impacts on local communities, supporting the next generation of environmentally responsible offshore energy development in the Gulf of America.

### DRAFT VISION STATEMENT

A Gulf of America where the next generation of energy development coexists and supports vibrant communities, thriving wildlife, healthy habitats, and sustainable ocean use, achieved through transparent, science-based collaboration and shared knowledge.

### WORK TO DATE

## **Examples of Regional Science Entities**

| Entity   | Region            | Focus  | Lead / Host Organization  |

## WHAT IS GOAA?

The Gulf Alliance is a regional network of stakeholders, initiated by the governors of the five Gulf States in 2004 to collectively address issues of common concern.

### **Our Mission**

To enchance the ecological and economic health of the Gulf of America through increased regional collaboration

### How?

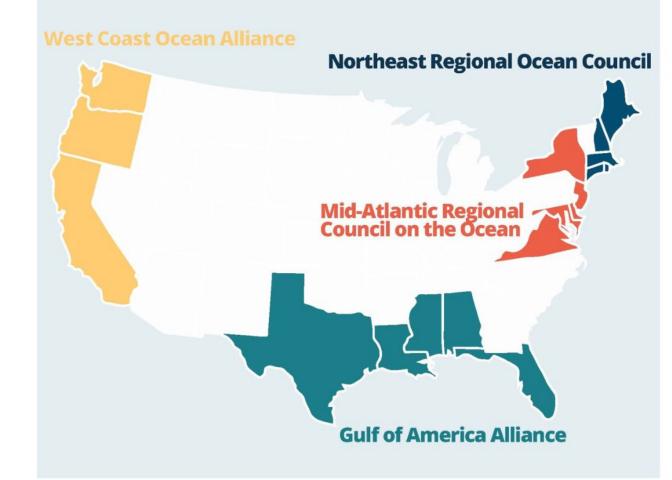

We work in accordance with an Action Plan and implement projects that address our priorty issues

### Who?

State and Federal agencies, academia, non-profits, business & industry representatives

## AUTHORIZATION FOR REGIONAL OCEAN PARTNERSHIPS

### Authorizes ROPs:

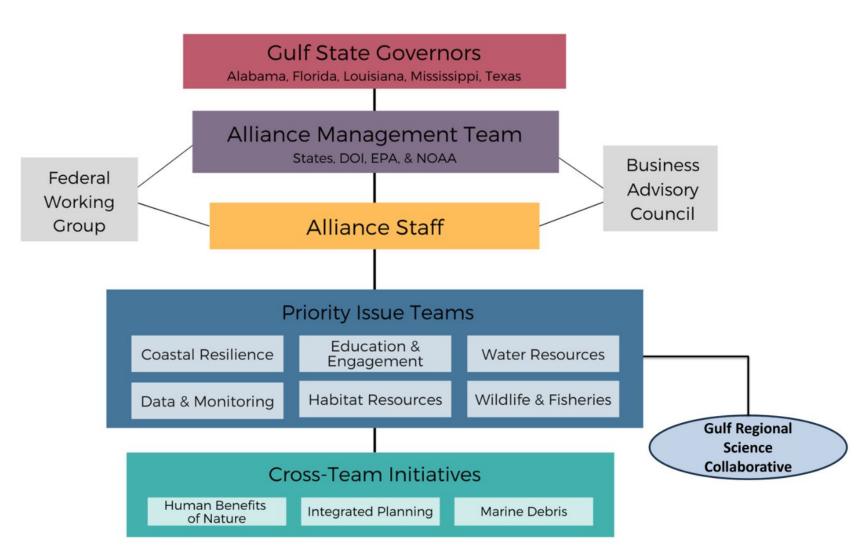

- West Coast
- North Atlantic
- Mid-Atlantic
- Gulf of America

### How We Are Organized

- Approximately 1100+ active members
- 165 organizations that participate in various teams, councils, working groups

- Alliance Management Team
- Federal Working Group
- Business Advisory Council
- Priority Issue Teams
- Cross-Team Initiatives

## **Research Highlights**

## A synthesis of socioeconomic and sociocultural indicators for assessing the impacts of offshore renewable energy on fishery participants and fishing communities

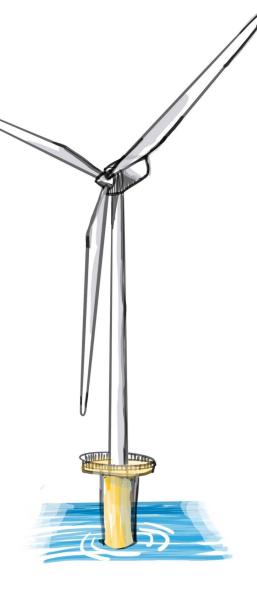

Ellen Willis-Norton, Tracey Mangin, Donna Schroeder, Reniel B. Cabral<sup>,</sup> and Steven D. Gaines

Bren School of Environmental Science & Management

# Introduction

- Offshore wind energy is rapidly expanding globally
- Addition of structures may impact fish production and preclude fishers from historical fishing grounds
- It is important to understand the socioeconomic and sociocultural impacts of offshore wind development to:
  - identify appropriate mitigation strategies
  - develop data collection, monitoring strategies, and adaptive management strategies

Objectives

Synthesize quantitative and qualitative indicators used to identify the impacts of offshore wind to fisheries

# Serve as a guide to those designing monitoring plans and community benefit agreements

# Methods

Systematic review of three causes for fisheries displacement:

- 1. vessel preclusion from marine renewable energy sites
- 2. marine spatial closures
- 3. shifts in fishery operations due to climate change

67 studies 49 indicators **9 categories** 

# Information Provided

- Brief description (with calculation if needed)
- Required methods and datasets
- Example use

# Changes in catch and revenue

Total catch

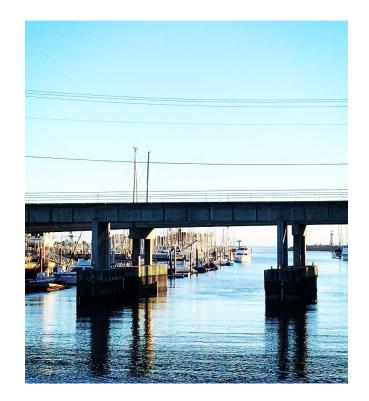

•% of region-wide landings from closed area

- Total revenue (ex-vessel value)
- •% of region-wide revenue from closed area
- Catch quality
- Catch composition
- Catch per unit effort
- •Value per unit effort
- •Value per unit effort

# Changes in time spent on the water and in distance to port

- Time at sea
- Steaming time/ distance traveled
- Fishing effort
- % of effort inside closed area
- Number of fishing trips
- Primary landing port

## **Competition and safety concerns**

- Competition (vessel density / crowding)
- Collision and capsizing risk
- Trips during dangerous conditions

# Shifts in fishing costs

- Fixed costs (insurance, moorage/slip costs)
- Capital expenses (new license, new gear)
- Variable costs (fuel, maintenance)
- Average fleet cost (  $\frac{total cost}{catch}$  )

## Shifts in fishery profit

- Profit
- Gross value added (revenue fuel cost)
- Resource rent (revenue cost subsidies)

# Livelihood and economic well-being effects

- Fisher's income
- Entrance and exit (# of fishers or vessels)
- Access and ability to switch to alternative economic opportunities
- Economic well-being

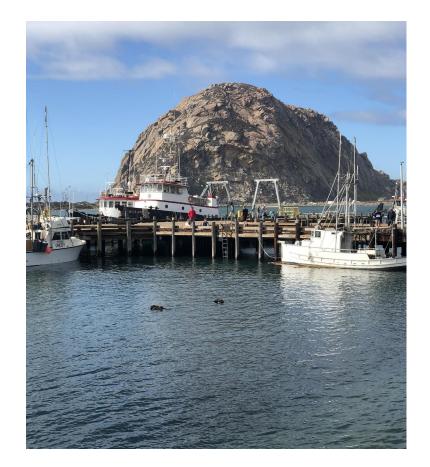

# **Community level impacts**

- Total income generated in the county economy from fishing
- Fishing community infrastructure
- Tourism
- Food security / availability

# Cultural and identity consequences

- Place-based identity
- Job satisfaction
- Traditional knowledge / cultural heritage
- Mental health

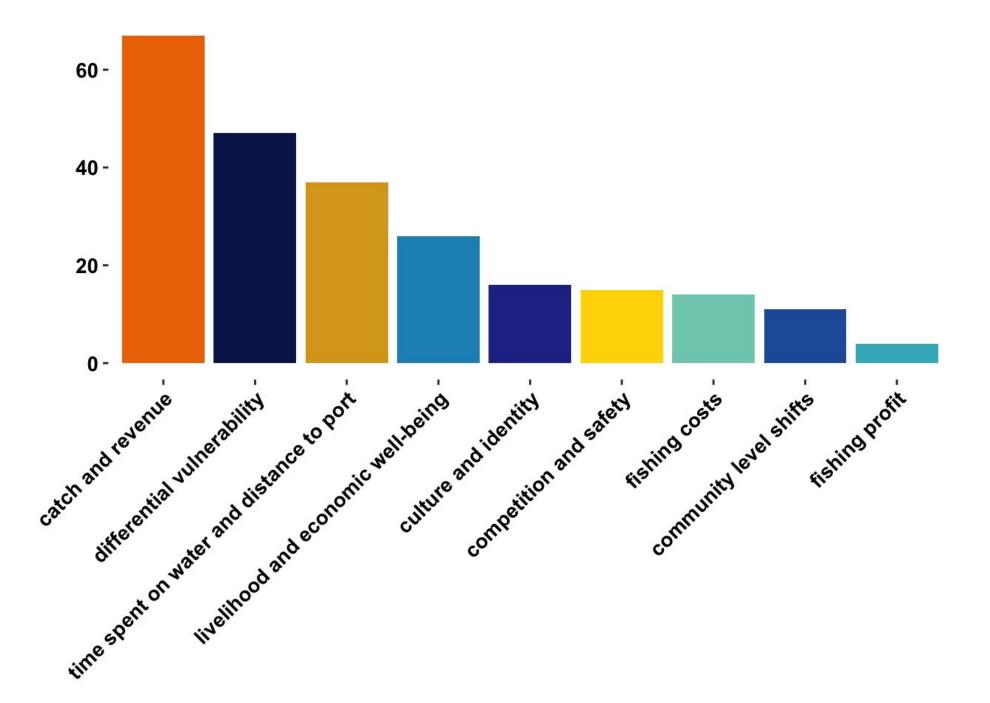

## Indicators to assess fishers' differential vulnerability

### Vessel attributes:

- Gear type / target species
- Vessel specifications
- Number of target species / permits associated with vessel
- Vessel home port

### Fisher attributes:

- Dependence on fishing
- Number of dependents supported by fishing
- Wealth reserves
- Underrepresented groups
- Years spent fishing / fishers' age
- Previous employment
- Ability to fish out of other ports / boats
- Member of fisher association
   / network

# Summary

- Most common indicators were direct economic impacts
- Qualitative methods were often used to:
  - 1. deepen understanding of economic impacts
  - 2. provide context for unexpected results
  - 3. expand the scope of the analysis
- For most studies, only potential impacts were examined and often reported negative impacts of offshore wind.
- Studies measuring indicator values pre- and post-closure often reported neutral to positive effects.

## Acknowledgements

Study collaboration and funding were provided by the U.S. Department of the Interior, Bureau of Ocean Energy Management, Environmental Studies Program, Washington, DC under Agreement Number M21AC00023.

## Action Items, Next Steps, and Other Business

### RWSC RFPs: proposals.rwsc.org/rfps

- Support for regional monitoring and research for marine wildlife and habitat in U.S. Atlantic waters (Apr. 1)
- Conduct Passive Acoustic Monitoring and Data Management to Support the POWERON Initiative (Apr. 7)

#### **Requests for Proposals**

February 27, 2025
